PROJECTS

- **Spanning Congestion Signaling over NextG Networks for Interactive Applications** Aug. 2024 - Current
 - Integrated the explicit congestion notification (ECN) marking mechanism into the 5G network to achieve ultra-low latency and adequate throughput utilization.
 - In submission to SIGCOMM 2025.
- **Enhancing Mobile Cloud Gaming through 5G NR-Scope Telemetry** May 2023 - Oct. 2024
 - Developed a tool called NR-Scope to analyze 5G base station's signal with a USRP, which can decode the downlink control information for every user in every transmission time interval (0.5 ms) in the RAN, revealing both uplink and downlink resource allocated to every user in the 5G physical layer.
 - Enhanced the real-time video streaming of an open-source mobile cloud gaming platform (sunshine and moonlight) with the fine-grained RAN resource information.
 - The NR-Scope tool was accepted by CoNEXT 2024 and is open source at <https://github.com/PrincetonUniversity/NR-Scope>. The cloud gaming part was posted on Arxiv.
- **General Corpus Silent Speech Recognition with mmWave Radar** Dec. 2021 - Nov. 2022
 - Did a comprehensive study on silent speech recognition with mmWave radar, the corpus is formed with 1000+ daily conversation sentences, and we collected 21K+ samples as our dataset.
 - Designed a signal processing pipeline for localizing users' head and filtering out unrelated motions.
 - Proposed a transformer-based neural network backend with user-adaptive design to recognize the speech and achieved words error rate comparable with video-based SOTA.
 - This work was accepted by Ubicomp/IMWUT 2023.
- **Air Temperature Field Reconstruction with COTF Acoustic Devices** Apr. 2021 - May. 2022
 - Estimated the air temperature with shorter response time than traditional temperature sensors by monitoring the speed changes of the sound signal. Achieve average errors 0.25°C across months of evaluations.
 - Modified Radon transform to reconstruct the air temperature field with decimeter-level spatial resolution.
 - Leveraged LOS paths and reflections for in-car temperature estimation.
 - This work was accepted by Ubicomp/IMWUT 2022 and won the Distinguished Paper Award.
- **High Accuracy Localization System between Distributed Devices** Aug. 2020 - Mar. 2021
 - Modeled the sampling frequency offset between distributed acoustic devices precisely.
 - Canceled the frequency offset and unknown delays in sound playback and recording process between devices in real time, and return the absolute distance measurement without user's intervention/calibration.
 - Achieve 0.6 mm 1D localization errors up to 3 m and 1.86 mm 3D localization errors. Maintain the accuracy in long-term without performance drop (up to 8 hours).
 - This work was accepted by TMC.
- **Multi-user Room-scale Respiration Tracking using COTS Acoustic Devices** Sept. 2019 - Aug. 2020
 - Expand the acoustic-based respiration sensing range to 3 m by combining multiple reflection paths.
 - Separate multiple users with modulated Zadoff-Chu sequence and can recover the breath patterns for at least 4 users in the same room simultaneously.
 - Track users by re-synchronizing the reflection signals before and after users move.
 - This work was accepted by INFOCOM 2021.
