## RESEARCH INTEREST

---

My current research interests are mobile and ubiquitous computing, including designing and implementing ubiquitous and wireless sensing systems for Internet-of-Things applications (localization, smart homes/buildings, vital sign monitoring/healthcare, and 3D human-mobile interaction). Besides, I have a broad interest in wireless network as well. Currently, most of my projects are based on acoustic signals on commercial-off-the-shelf mobile devices.

## MAJOR PROJECTS

---

- **General Corpus Silent Speech Recognition with mmWave Radar** Dec. 2021 - Nov. 2022
  - Did a comprehensive study on silent speech recognition with mmWave radar, the corpus is formed with 1000+ daily conversation sentences, and we collected 21K+ samples as our dataset.
  - Designed a signal processing pipeline, including cluster selection algorithm to localize users' head and filter out unrelated motions.
  - Proposed a transformer-based neural network backend with user-adaptive design to recognize the speech and achieved words error rate comparable with video-based SOTA (< 10%).
  - This work was accepted by Ubicomp/IMWUT 2023.
- **Air Temperature Field Reconstruction with COTF Acoustic Devices** Apr. 2021 - May. 2022
  - Estimate the air temperature with shorter response time than traditional temperature sensors by monitoring the speed changes of sound signal. Achieve average errors 0.25°C across months of evaluations.

- Combine Radon transform and Taylor Series to reconstruct the air temperature field with decimeter-level spatial resolution using multiple acoustic devices.
- Leverage LOS paths and reflections to estimate the temperature in multiple slots in a car or on the table with only one pair of devices.
- This work was accepted by Ubicomp/IMWUT 2022.
- **High Accuracy Localization System between Distributed Devices** Aug. 2020 - Mar. 2021
  - Model the sampling frequency offset between distributed acoustic devices precisely.
  - Cancel the frequency offset and unknown delays in sound playback and recording process between devices in real time, and return the absolute distance measurement without user's intervention/calibration.
  - Achieve 0.6 mm 1D localization errors up to 3 m and 1.86 mm 3D localization errors. Maintain the accuracy in long-term without performance drop (up to 8 hours).
  - This work was accepted by TMC.
- **Multi-user Room-scale Respiration Tracking using COTS Acoustic Devices** Oct. 2019 - Aug. 2020
  - Expand the acoustic based respiration sensing range to 3 m by combining multiple reflection paths.
  - Separate multiple users with modulated Zadoff-Chu sequence, and can recover the breath patterns for at least 4 users in the same room simultaneously.
  - Track users by re-synchronizing the reflection signals before and after users move.
  - This work was accepted by INFOCOM 2021.
- **In-air Continuous Hand Gesture Recognition with Acoustic Signal** Nov. 2019 - Feb. 2020
  - Develop a continuous hand gesture recognition system on mobile phone with acoustic signal, cooperating with partners in industry.
  - Solve the practical problem of ambiguous gestures in continuous using scenario, e.g. scrolling up is similar to the reset process of scrolling down in consecutive use.
  - Design and deploy signal processing algorithm and deep learning model on mobile phone that run in real-time.
